# ERROR MESSAGES IN PYTHON

One of the most beginner-friendly improvements is the smarter error messages — especially for typos and incorrect function usage.

```python
def greet(name):
    print("Hello", name)

gret("Oscar")   # Oops, typo!
```

Before Error Message

```
NameError: name 'gret' is not
defined
```

After Error Message

```
NameError: name 'gret' is not
defined. Did you mean: greet?
```
